* Numbering system recommended by the International Union of Pure and Applied Chemistry (IUPAC)

** Previous IUPAC numbering system

*** Numbering system recommended by the Chemical Abstracts Service

**** For the names of elements 104–112, see table.

^{252}Cf – Production

n – irradiation of transuranic elements

Fig. 26.1. Diagram Showing the Production of ^{252}Cf .

$^{252}_{98}\text{Cf}$ - decay

Half-life (effective):	2.65 years
Half-life (spontaneous fission):	85.5 years
Half-life (α -decay):	2.73 years
Neutron emission:	$2.3 \cdot 10^{12}$ neutrons/s per gram
Average neutron energy:	2 MeV
Specific activity:	$2.0 \cdot 10^{13}$ Bq per gram

~ 500 Ci per gr , **1Ci = 2 mgr**

^{252}Cf - Energy Spectrum

Fig. 26.2. Typical Pulse Height Spectrum for a Thin ^{252}Cf Fission Foil Source.

Fragment	Energy
Light $^{106}_{46}\text{Pd}$	102.58
Heavy $^{142}_{60}\text{Nd}$	78.67

^{252}Cf – FF Mass distribution

Fig. 26.4. Mass Distribution of Fission Fragments for ^{252}Cf .

FF Mass distributions –Comparison

	Z1	A1	Z2	A2
Cf	45	105	60	140
U	40	90	55	135

Nuclear Landscape

Fusion-evaporation
fragmentation

n-rich region : next frontier, exploration has started (HRIBF) and new facilities are under construction (RIA , SPIRAL2-GANIL, SPES-LNL....)

^{252}Cf fission

**Provides unique beams
 complementary to HRIBF**

~ 100 beams with $I \geq 10^3$ pps

$E/A = 3 \text{ MeV/A}$

(by Uranium Fission)

^{252}Cf @ ATLAS (Argonne) - Source Upgrade

- Commercial Source produced by Oak Ridge (15-20 K\$)
- Produced of the required strength in various forms.
- Obtained by electrodeposit on a thick tantalum backing (s= 2.5 mm).

$$1 \text{ Ci} = 3.7 \times 10^{10} \text{ Bq}$$

$$\varnothing = 5\text{cm}$$

$$\rho = 51 \text{ mCi/cm}^2$$

- Covered by a

$$2 \text{ mg/cm}^2, \text{ Au foil}$$

located 1mm above the source for protection and confinement.

It will enclose the source, except for a pumping hole to equilibrate pressure inside the trapped volume with the gas catcher pressure

New opportunity: ^{252}Cf source + large gas catcher as neutron-rich isotope source

- Shortened version of RIA gas catcher can efficiently stop fission products from a fission source
 - ~ 50% stopped in gas for backed source
- About 45% of those can be extracted as charged ions
- Very efficient and fast source, provides cooled bunched beams for post-acceleration
- Production peaks in new regions and extraction is element independent ...
new isotopes available

Gas catcher technology developed, tested and now routinely used at ATLAS for CPT and RIA programs

Proposed Charge-Breeder Scheme

Extracted isotope yield at low energy @ATLAS

- 1 Ci ^{252}Cf source
- ~100 beams with $i \geq 10^6$ pps

Examples of Yields for Representative Species

Calculated maximum beam intensities for a 1 Ci ^{252}Cf fission source using expected efficiencies.

Isotope	Half-life (s)	Low-Energy Beam Yield (s^{-1})	Accelerated Beam Yield (s^{-1})	LNS
^{104}Zr	1.2	6.0×10^5	2.1×10^4	0.4×10^4
^{143}Ba	14.3	1.2×10^7	4.3×10^5	0.8×10^5
^{145}Ba	4.0	5.5×10^6	2.0×10^5	0.4×10^5
^{130}Sn	222.	9.8×10^5	3.6×10^4	0.7×10^4
^{132}Sn	40.	3.7×10^5	1.4×10^4	0.3×10^4
^{110}Mo	2.8	6.2×10^4	2.3×10^3	0.6×10^3
^{111}Mo	0.5	3.3×10^3	1.2×10^2	0.24×10^2

$^{92-94}\text{Kr}$

1-4

3×10^5

2×10^4

0.5×10^4

~65 species have accelerated intensities of over 10^5

>150 additional species have accelerated intensities of over 10^4

By L.Calabretta

ATLAS Project planning

Cost - 5 M\$

Manpower - 10.5 man year

Realization Time - 2 years

@LNS , we need (by L.Calabretta)

Restyle the CS central region to get the injection of accelerated beams at 50-60 kV (now possible up to 30 kV)

Increase the injection line transmission efficiency (the higher energy help us to do this!)

Search of ^{252}Cf source manufacturer in Europe

Contact to Oak- Ridge

Contact to ATLAS to buy the GAS Catcher, the RFQ-cooler and the Charge Breeder

Important physics questions

- **modification of nuclear structure in neutron rich systems**
 - *shell-structure quenching*
 - *single particle structure near n-rich magic nuclei*
 - *pairing interaction in weakly bound systems*
- **collective behavior in neutron-rich systems**
- **r-process path**
 - *ground-state information*
 - mass
 - lifetime
 - beta-delayed neutron branching ratio
 - *neutron capture rate*
 - *fissionability of very heavy n-rich isotopes*

Important Physics Questions

- *EoS of Asymmetric nuclear matter*
 - *Density dependence of Symmetry Energy*
 $\rho < \rho_0$ nuclear structure, astrophysical problems ,
($\overrightarrow{\text{neutron}}$ star crust, ...)
 - *Nuclear structure and properties of n-rich systems*
 - *Neutron skin*
 - *Pigmy dipole (PDR)*
 - *GDR, GMR in n-rich nuclei*
 - *Isospin Physics and reaction mechanism*
 - *time scaling*
 - *fission reaction*
 - *fusion reaction*
 - *dynamical dipole (DDR)*
 - *neck dynamics*
 - *N/Z equilibration*
- in collaboration with M.Colonna*

Conclusions

- This project would allow the production of **unique exotic beams at Intermediate energy** in a “reasonable” time.
 - It will keep **LNS competitive in radioactive beam delivering.**
 - It will increase **the techniques and expertise** necessary to explore n-rich region
 - This project has to be seen **in synergy with SPES @LNL** (preparatory , common technological development)
 - It has to be well compared with the possibility to get exotic beams by ***Fragmentation in Flight*** technique with heavy primary projectile
- (CHIMERA group in next experiments @LNS)
